protein kinase (EC 2.7.1.37) cdc2-related CRK1 - Leishmania mexicana
C:Species: Leishmania mexicana
C:Date: 10-Sep-1999 #sequence_revision 10-Sep-1999 #text_change 10-Sep-1999
C:Accession: A48041; S31366
R:Mottram, J.C.; Kinnaird, J.H.; Shials, B.R.; Tait, A.; Barry, J.D.
J. Biol. Chem. 268, 21044-21052, 1993
A:Title: A novel CDC2-related protein kinase from Leishmania mexicana, LmmCRK1, is post-A:Reference number: A48041; MUID:94012652; PMID:8407941
A:Accession: A48041
A;Status: nucleic acid sequence not shown
A:Residues: 1-301 cMOT>
A;Cross-references: EMBL:X60385; NID:99539; PIDN:CAA42936.1; PID:99540
C:Superfamily: kinase-related transforming protein; protein kinase homology
C:Keywords: ATP: phosphotransferase
F:3-257/Domain: protein kinase homology <KIN>
F:11-19/Region: protein kinase ATP-binding motif
F:34,52,127,129/Active site: Lys, Glu, Asp, Lys #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 15

                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ••

                                                                                                                                                                                                                                                                                                                            sequence relatedness, e.g., seven-pass transmembrane receptor protein (MEMI), glutamate receptor (MEM2-MEM4), pocassium channel protein (MEM5), oppossium channel protein (MEM5), and retinol-binding protein (MEM6). The MEM polypeptides (I), nucleic acids (II), and antibodies (III) are all useful for treating or preventing a pathology associated with (I) comprising administering (I), (II), or (III) to a subject (preferably a human). In addition, (I), (II), and (III) may be used to manufacture a medicament for treating a syndrome associated with a human disease that is associated with (I). Furthermore, (I) may be used to identify agents that bind to it, screen modulators of its activity and determine the presence or predisposition to a disease associated with altered levels of (II). Disorders for MEM1 include Alzheimer's or Parkinson's Disease.

(II) Disorders for MEM1 include Alzheimer's or Parkinson's Disease.

(II) Disorders for MEM1 include Alzheimer's or Parkinson's Disease.

(II) Disorders for MEM1 include Alzheimer's or Parkinson's Disease.

(III) MEM5, disorders include heart (arrhythmic disorders) and other muscular disorders include heart (arrhythmic disorders).

                                                                                                                                                                                                                                                                á
                                                                                                                                                                                                                                                                                                                                                                                              CC full-length cDNAs defined in the specification. Where a primer set to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the CC oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises a 5'-end CC sequence and an oligonucleotide comprises a 5'-end CC sequence and an oligonucleotide comprises a 5'-end sequence complementary to a coligonucleotide comprises a 3'-end sequence, where the CC oligonucleotide comprises a 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in CC the 5'-end sequence/3'-end sequence is selected from those defined in CC the specification. The primer sets can be used in antisense therapy and CC angles therapy. The primers are useful for synthesising polynucleotides, CC particularly full-length cDNAs. The primers are also useful for the CC detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length CDNAs easily without any specialised methods. AAH03166 to AAH1368 and CC AAB95893 represent human amino acid sequences; AAB92446 to CAB95893 represent human amino acid sequences; AAB92446 to CC of the present invention.

The invention relates to the medicinal use of a compound capable of blocking the interaction of phosphorylase alpha with GL, where the compound comprises the present peptide sequence or a fragment of it. When phosphorylase alpha binds to GL it potently inhibits glycogen synthase phosphatase activity and inhibits glycogen synthesis, this contributes to high blood glucose levels. The invention also relates to a method for identifying the compound. The compound can be used to reduce the blood glucose level of a mammal, particularly a human, in hyperglycaemic disorders such as type I or type II diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Lowering blood sugar levels in the treatment of diabetes, us compound that blocks interaction between phosphorylase alpha protein phosphatase 1 glycogen-targetting subunit -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Protein phosphatase 1; PP1; glycogen targetting subunit; blood glucose; phosphorylase alpha; glycogen synthesis; hyperglycaemic disorder; GL; type I diabetes; type II diabetes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      neutral calcium-activated cystein protease (calpain) family. The spatial structure (especially crystalline forms) are used for structure-function studies, particularly for identifying (pseudo)substrates, inhibitors and activators of calpains, potentially useful for treatment of ischemic conditions, muscular dystrophy and/or tumors. The products of the invention have anti-ischemic, muscular and antitumor activity. This sequence represents the rat calpain 80kba subunit described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (PLAC )

The present invention relates to the isolation of novel human enzyme polypeptides, and the cDNA (AAS40785-AAS41684) and genomic sequences encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of a wide range of disorders including hyperproliferative disorders (e.g. cancer),
                                                                                                                                                                                                                          Novel polypeptides and polynucleotides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cance
                                                                                                                                                                       Claim 11;
                                                                                                                                                                                                                                                                                                                                                                              Rosen

                        AAW19992 represents human calcium activated neutral protease (CANP). This protein was found to have an area of high homology with an interleukin-1 receptor (IL-1-R) intracellular ligand (encoded by cDNA clone 14w, see AAT71218) and thus will display some of the same properties of this protein. IL-1-R intracellular ligand proteins are used to screen for agents (e.g. antibodies) that are capable of inhibiting or blocking the binding of an IL-1-R intracellular ligand to the intracellular domain of IL-1-R, i.e. inhibitors of IL-1 activity. Such agents can be used to treat inflammatory conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        immunodeficiency disorders (e.g. AIDS) autoimmune disorders (e.g. arthritis), neurological disorders (e.g. Alzheimer's disease), metabolic disorders (e.g. phenylketonuria), inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), blood-related disorders (e.g. haemophilia), reproductive disorders (e.g. infertility) and infectious disorders (e.g. Influenza). The polynucleotides of the invention can also be used in gene therapy. ANU23915-AAU23814 represent the novel human enzyme polypeptides of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             invention.

Note: The sequence data for this patent did not specification, but was obtained in electronic fo at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

This invention describes the novel spatial structure of human and rat neutral calcium-activated cystein protease (calpain) family. The spatial structure (especially crystalline forms) are used for structure-function studies, particularly for identifying (pseudo)substrates, inhibitors and activators of calpains, potentially useful for treatment of ischemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Calpain; calcium-activated cystein proteinase; human; spatial structure; Ca-activated cystein proteinase; protein coordinate data; treatment; structure-function study; ischemic condition; muscular dystrophy; tumor;

Also the polynucleotide encoding capn12 is useful, ea primers and probes, diagnosis of diseases, or predisposition to them, and for recombinant production of capn12. This sequence represents the calpain protease capn12 protein described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Not

The calpain protease of the invention, related proteins and nucleic acid that encodes it, are useful for treatment (including gene therapy) of diseases associated with insufficient expression of the calpain protease. The protein is also used to screen for calpain protein effectors and to raise specific immunoglobulins (Ig) useful for diagnosis. Also the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     that encodes it, are useful for treatment (including gene therapy) of diseases associated with insufficient expression of the calpain protease. The protein is also used to screen for calpain protein effectors and to raise specific immunoglobulins (Ig) useful for diagnosis. Also the polynucleotide encoding capn12 is useful, e.g. as primers and probes, for diagnosis of diseases, or predisposition to them, and for recombinant production of capn12. This sequence represents the calpain protease splice variant capn12C described in the disclosure of the invention.
                                                                                                                                                                                        Claim 2;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
                                                                                                                         This invention describes a novel murine calpain protease 12 (capn12). The calpain protease of the invention, related proteins and nucleic act that encodes it, are useful for treatment (including gene therapy) of diseases associated with insufficient expression of the calpain protea The protein is also used to screen for calpain protein effectors and traise specific immunoglobulins (Ig) useful for diagnosis. Also the polynucleotide encoding capn12 is useful, e.g. as primers and probes, diagnosis of diseases, or predisposition to them, and for recombinant production of capn12. This sequence represents the calpain protease splice variant capn12A described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                polynucleotide encoding capn12 is useful, e.g. as primers and probes, diagnosis of diseases, or predisposition to them, and for recombinant production of capn12. This sequence represents the calpain protease splice variant capn12B described in the disclosure of the invention.

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table in the specification). ABN15762 to ABN27252 encode the human ORFX proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating syndrome associated with ORFX-associated disorder. ORFX polynucleotide
                                                                                                                                                                                      lupus erythematosus, hypertension, hypothyroidism, cholesterol ester storage disease, various immune deficiencies and disorders, infectious diseases, autoimmune disorders such as multiple sclerosis, rheumatoid arthritis, autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis,
                                                                                                                                                                                                                                                                                                               sequences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage, osteoarthritis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular diseases, diabetes mellitus, systemic transplantation, cardiovascular diseases, diabetes mellitus, systemic transplantation, cardiovascular diseases, diabetes mellitus, systemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      hyperproliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; hypertension; hypothyroidism; cholesterol ester storage disease;
                                     N.B. The sequence data for this patent did not specification, but was obtained in electronic for at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                           bone degenerative disorders, or periodontal disease, and for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from

The present sequence represents a targeting ligand directed to the CC GPIIbIIIa receptor. The invention relates to a contrast agent for CC diagnostic imaging or a target composition which comprises: (i) a lipid, CC protein or polymer and (ii) a gas, in combination with (iii) a targeting CC ligand (T1). Tl targets cells or receptors selected from myocardial, CC endothelial, epithelial and tumour cells and the glycoprotein GPIIb/IIIa CC receptor. Also claimed are: a composition comprising vesicles containing CC (i) - (iii) and an aqueous carrier; a targeted vesicle composition CC comprising a fluorinated gas and a targeting ligand (T1) which targets tissues or receptors; a formulation for therapeutic or diagnostic use comprising (i) (iii) and a bioactive agent; and a method for providing an internal region of a patient, or for diagnosing the presence CC of diseased tissue, comprising: (a) administration of a composition as above; and (b) scanning the patient using ultrasound to obtain a visible cuseful for imaging or diagnosing the presence of diseased tissue. The methods and compounds are cuseful for imaging or diagnosing the presence of diseased tissue but also CC gastrointestinal and cardiovascular regions. In particular the ligand CC targets regions of arteriosclerosis. Stabilised vesicles are used to deliver active agents to an intended target such as tissue or a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 15

ABSTRACT:

Human PPP1R5 polypeptides and DNA (RNA) encoding such PPP1R5 and a procedure for producing such polypeptides by recombinant techniques is disclosed. Also disclosed are methods for utilizing such PPP1R5, or compounds which inhibit or stimulate PPP1R5 for dysfunctions or diseases which involve resistance to the action of insulin on glycogen synthesis are also disclosed. Agonist and antagonists of these PPP1R5 proteins and methods of their use are also disclosed. Also disclosed are diagnostic assays for detecting diseases related to mutations in the nucleic acid sequences and altered concentrations of the polypeptides. Also disclosed are diagnostic assays for detecting mutations in the polynucleotides encoding the PPP1R5 and for detecting altered levels of the polypeptide in a host.

ABSTRACT:

Plants with an altered starch synthesizing ability are produced by incorporating into the genome of the plant at least one donor gene encoding a starch primer. The starch primer is an enzyme capable of initiating starch synthesis, such as an amylogenin and/or glycogenin. DNA constructs encoding a starch primer are provided, particularly constructs encoding amylogenin from maize.

ABSTRACT:

The present invention relates to a mutant DNA sequence encoding protein phosphatase 1 G-subunit, wherein a mutation of G to T occurs in the position of codon 905 of the coding sequence, a method of detecting a mutation in the gene encoding protein phosphatase 1 G-subunit, as well as a diagnostic composition and a test kit for use in the method.

ABSTRACT:

Methods for treating conditions associated with elevated, inappropriate or undesired post-prandial blood glucose levels are disclosed which comprise administration of an effective amount of an amylin agonist alone or in conjunction with other anti-gastric emptying agents. Methods for reducing gastric motility and delaying gastric emptying for therapeutic and diagnostic purposes are also described.

ABSTRACT:

Promoters for enhanced expression of ADPglucose pyrophosphorylase in potato tubers and fruits such as tomato; methods of using them; DNA molecules, plant cells and plants containing them. A method of decreasing the oil content of seeds by expression of ADPglucose pyrophosphorylase.

ABSTRACT:

The present invention is directed to the assay and purification of proteins, and particularly to the non-radioactive assay and purification of protein kinases, phosphatases and protease by incubating the enzyme with a substrate modified peptide to form a product modified peptide under conditions where the enzyme is active. The product modified peptide and substrate modified peptide are then separated, and the product modified peptide is measured. The present invention is also directed to kits and bioreagents for performing the assays.

Yasuda; Yukio	Kanagawa			JP
Nagatomo; Shigeru	Kanagawa			JP
Makiuchi; Hajime	Kanagawa			JP
Okazaki; Masaki	Kanagawa			JP

ABSTRACT:

An analysis film comprises a reagent layer composed of a porous material which contains an antibody but does not substantially contain a complex of an analyte or a labelled antigen with the antibody. In the analysis film, reagents for enzyme immune reaction of homogenous type are incorporated so that an analyte is analyzed without requiring B/F separation. An analysis method for various analytes using the same provides high sensitivity, high accuracy as well as good reproducibility and is simple and rapid.

CORPORATE SOURCE: Departments of Biochemistry and Internal Medicine and the Touchstone Center for Diabetes Research, University of Texas Southwestern Medical Center, Dallas, TX, 75390, USA SOURCE: Journal of Biological Chemistry (2002), 277(2), 1524-1530 CODEN: JBCHA3; ISSN: 0021-9258 PUBLISHER: American Society for Biochemistry and Molecular Biology DOCUMENT TYPE: Journal LANGUAGE: English Glycogen-targeting subunits of protein phosphatase-1 facilitate interaction of the phosphatase with enzymes of glycogen metab. Expression of one family member, PTG, in the liver of normal rats improves glucose tolerance without affecting other plasma variables but leaves animals unable to reduce hepatic glycogen stores in response to fasting. In the current study, we have tested whether expression of other targeting subunit isoforms, such as the liver isoform GL, the muscle isoform GM/RGl, or a truncated version of GM/RGl termed GM.DELTA.C in liver ameliorates glucose intolerance in rats fed on a high fat diet (HF). HF animals overexpressing GM.DELTA.C, but not GL or GM/RGl, exhibited a decline in blood glucose of 35-44 mg/dL relative to control HF animals during an oral glucose tolerance test (OGTT) such that levels were indistinguishable from those of normal rats fed on std. chow at all but one time point. Hepatic glycogen levels were 2.1-2.4-fold greater in GL- and GM.DELTA.Coverexpressing HF rats compared with control HF animals following OGTT. In a second set of studies on fed and 20-h fasted HF animals, GM.DELTA.C-overexpressing rats lowered their liver glycogen levels by 57%

(from 402 .+-. 54 to 173 .+-. 27 .mu.g of glycogen/mg of protein) in the fasted vs. fed states compared with only 44% in GL-overexpressing animals (from 740 .+-. 35 to 413 .+-. 141 .mu.g of glycogen/mg of protein). Since the OGTT studies were performed on 20-h fasted rats, this meant that

		9	

GM. DELTA. C-overexpressing rats synthesized much more glycogen than GL-overexpressing HF rats during the OGTT (419 vs. 117 .mu.g of glycogen/mg of protein, resp.), helping to explain why GM.DELTA.C preferentially enhanced glucose clearance. We conclude that GM.DELTA.C has a unique combination of glycogenic potency and responsiveness to glycogenolytic signals that allows it to be used to lower blood glucose levels in diabetes.

LANGUAGE: English Overexpression of the glucose-phosphorylating enzyme glucokinase (GK) or

members of the family of glycogen-targeting subunits of protein phosphatase-1 increases hepatic glucose disposal and glycogen synthesis. This study was undertaken to evaluate the functional properties of a novel, truncated glycogen-targeting subunit derived from the skeletal muscle isoform GM/RG1 and to compare pathways of glycogen metab. and their regulation in cells with overexpressed targeting subunits and GK. When overexpressed in hepatocytes, truncated GM/RG1 (GM.DELTA.C) was approx. twice as potent as full-length GM/RGl in stimulation of glycogen synthesis, but clearly less potent than GK or two other native glycogen-targeting subunits, GL and PTG. We also found that cells with overexpressed GM.DELTA.C are unique in that glycogen was efficiently degraded in response to lowering of media glucose concns., stimulation with forskolin, or a combination of both maneuvers, whereas cells with overexpressed GL, PTG, or GK exhibited impairment in one or both of these glycogenolytic signaling pathways. 2H NMR anal. of purified glycogen revealed that hepatocytes with overexpressed GK synthesized a larger portion of their glycogen from triose phosphates and a smaller portion from tricarboxylic acid cycle intermediates than cells with overexpressed glycogen-targeting subunits. Addnl. evidence for activation of distinct pathways of glycogen synthesis by GK and targeting subunits is provided by the additive effect of co-overexpression of the two types of proteins upon glycogen synthesis and a much larger stimulation of glucose utilization, glucose transport, and lactate prodn. elicited by GK. We conclude that overexpression of the novel targeting subunit GM.DELTA.C confers unique regulation of glycogen metab. Furthermore, targeting subunits and GK stimulate glycogen synthesis by distinct pathways.

DOCUMENT TYPE: Journal LANGUAGE: English

A complementary DNA encoding a novel human protein phosphatase 1 (PP1) glycogen-targeting subunit of mol. mass 33 kDa has been sequenced. PPP1R6 is 31% identical to the glycogen-targeting subunit (GL) of PP1 from rat liver, 28% identical to the N-terminal region of the glycogen-targeting subunit (GM) from human skeletal muscle and 27% identical to glycogen-targeting subunit PPP1R5. Unlike human PPP1R5 and its murine homolog PTG, whose mRNAs are most abundant in skeletal muscle, heart and liver, PPP1R6 is present at similar levels in a wide variety of tissues. The PPP1R6 is assocd. with glycogen in muscle but is not subject to the same modes of covalent and allosteric regulation as GM and GL.

AB Insulin has been previously shown to regulate the expression of the hepatic glycogen-targeting subunit, G(L), of protein

phosphatase 1 (PP1) and is believed to control the activity of the PP1-G(L) complex by modulation of the level of phosphorylase a, which allosterically inhibits the activity of PP1-G(L). These mechanisms contribute to the ability of insulin to increase hepatic glycogen synthesis. Human G(L) shows >88% amino acid identity to its rat and mouse homologs, with complete conservation of the phosphorylase a binding site. G(L) is highly expressed

in the liver and present at appreciable levels in heart tissue of all three species. Surprisingly, G(L) is highly expressed in human skeletal muscle while only being detected at very low levels in rat, mouse, and rabbit skeletal muscle. The amino acid sequence of G(L) predicted from the cDNA is identical in human liver and skeletal muscle and encoded by a gene on chromosome 8 at p23.1. The species-specific difference in the level of expression of G(L) mRNA and protein in skeletal muscle has important implications for understanding the mechanisms by which insulin regulates glycogen synthesis in human skeletal muscle and for questions regarding whether rodents are appropriate models for this purpose.

The glycogen-associated protein phosphatase (PP1G/ R(GL)) may play a central role in the hormonal control of glycogen metabolism in the skeletal muscle. Here, we investigated the in vivo epinephrine effect of glycogen metabolism in the skeletal muscle of the wild-type and R(GL) knockout mice. The administration of epinephrine increased blood glucose levels from 200 +/- +/- 20 to 325 +/- 20 mg/dl in both wild-type and knockout mice. Epinephrine decreased the glycogen synthase -/+ G6P ratio from 0.24 +/- 0.04 to 0.10 +/- 0.02 in the wild-type, and from 0.17 +/-0.02 to 0.06 \pm 0.01 in the knockout mice. Conversely, the glycogen phosphorylase activity ratio increased from 0.21 +/- 0.04 to 0.65 +/- 0.07 and from 0.30 +/- 0.04 to 0.81 +/- 0.06 in the epinephrine treated wild-type and knockout mice respectively. The glycogen content of the knockout mice was substantially lower (27 percent) than that of both wild-type mice; and epinephrine decreased glycogen content in the wild-type and knockout mice. Also, in Western blot analysis there was no compensation of the other glycogen targeting components PTG/R5 and R6 in the knockout mice compared with the wild-type. Therefore, R(GL) is not required for the epinephrine stimulation of glycogen metabolism, and rather another phosphatase and/or regulatory subunit appears to be involved.

Three functional domains are identified in the glycogentargeting subunit (GL) of rat liver protein phosphatase 1. Amino acid residues 94-267 of GL are required for binding to glycogen, the phosphorylase a-binding site lies in the C-terminal 16 amino acids, and the protein phosphatase 1-binding domain lies between residues 59 and 94. The present invention relates to to the C-terminal 16-amino acid domain (PEWPSYGYEKLYPYY) domain, which is useful for treating disorders assocd. with abnormal blood glucose levels in mammals, such as Type I and Type II diabetes. The invention also relates to methods of making and using the peptide and related compds. which block the interaction of phosphorylase a with GL of protein phosphatase 1.

AB Glycogen-targeting subunits of protein phosphatase-1

facilitate interaction of the phosphatase with enzymes of glycogen metab. We have shown that overexpression of one member of the family, protein targeting to glycogen (PTG), causes large increases in glycogen storage in isolated hepatocytes or intact rat liver. In the current study, we have compared the metabolic and regulatory properties of PTG (expressed in many tissues), with two other members of the gene family, GL (expressed primarily in liver) and GM/RGl (expressed primarily in striated muscle). Adenovirus-mediated expression of these proteins in hepatocytes led to the following key observations. GL has the highest glycogenic potency among the three forms studied. Glycogen synthase activity ratio is much higher in GL-overexpressing cells than in PTG or GM/RG1-overexpressing cells. Thus, at moderate levels of GL overexpression, glycogen synthase activity is increased by insulin treatment, but at higher levels of GL expression, insulin is no longer required to achieve maximal synthase activity. In contrast, cells with high levels of PTG overexpression retain dose-dependent regulation of glycogen synthesis and glycogen synthase enzyme activity by insulin. GL- and GM/RGl-overexpressing cells exhibit a strong glycogenolytic response to forskolin, whereas PTG-overexpressing cells are less responsive. This difference may be explained in part by a lesser forskolin-induced increase in glycogen phosphorylase activity in PTG-overexpressing cells. Based on these results, we suggest that expression of either GL or GM/RGl in liver of diabetic animals may

represent a strategy for lowering of blood glucose levels in diabetes.

Deletion and mutational analyses of the rat liver glycogentargeting subunit (GL) of protein phosphatase 1 (PP1) have identified three separate domains that are responsible for binding of PP1, glycogen and phosphorylase a. The glycogen-binding domain spans the centre of GL between residues 144 and 231 and appears to be distinct from the glycogen-binding (storage) site of phosphorylase. The regulatory high-affinity binding site for phosphorylase

ें 	*
	eri eri eri
	·
	(C)

a lies in the 16 amino acids at the C-terminus of GL. The PP1-binding domain is deduced to comprise the -RVXF- motif [Egloff, Johnson, Moorhead, Cohen and Barford (1997) EMBO J. 16, 1876-1887] located at residues 61-64 of GL and preceding lysine residues at positions 56, 57 and 59. A possible approach for increasing glycogen synthesis in certain disorders is discussed.

AB We have recently cloned from 3T3-L1 adipocytes a novel glycogentargeting subunit of protein phosphatase-1, termed PTG (Printen, J. A., Brady, M. J., and Saltiel, A. R. (1997) Science 275, 1475-1478). Differentiation of 3T3-L1 fibroblasts into highly insulin-responsive adipocytes resulted in a marked increase in PTG expression. Immobilized glutathione S-transferase (GST)-PTG fusion protein specifically bound either PP1 or phosphorylase a. Addition of soluble GST-PTG to 3T3-L1 lysates increased PP1 activity against 32P-labeled phosphorylase a by decreasing the Km of PP1 for phosphorylase 5-fold, while having no effect on the Vmax of the dephosphorylation reaction. Alternatively, PTG did not affect PP1 activity against hormone-sensitive lipase. PTG was not a direct target of intracellular signaling, as insulin or forskolin treatment of cells did not activate a kinase capable of phosphorylating PTG in vivo or in vitro. Finally, PTG decreased the ability of DARPP-32 to inhibit PP1 activity from 3T3-L1 adipocyte lysates. These data cumulatively suggest that PTG increases PP1 activity against specific proteins by several distinct

ABSTRACT IS AVAILABLE IN THE ALL AND IALL FORMATS

Hepatic glycogen synthesis is impaired in insulin-dependent diabetic AB rats owing to defective activation of glycogen synthase by glycogen-bound protein phosphatase I (PPI). The identification of three glycogen-targetting subunits in liver, G(L)R5/PTG and R6, which form complexes with the catalytic subunit of PP1 (PP1c), raises the question of whether some or all of these PP1c complexes are subject to regulation by insulin. In liver lysates of control rats, R5 and R6 complexes with PPlc were found to contribute significantly (16 and 21%. respectively) to the phosphorylase phosphatase activity associated with the glycogen-targetting subunits, G(L)-PP1c accounting for the remainder (63%). In liver lysates of insulin-dependent diabetic and of starved rats, the phosphorylase phosphatase activities of the R5 and G(L) complexes with PP1c were shown by specific immunoadsorption assays to be substantially decreased, and the levels of R5 and G(L) were shown by immunoblotting to be much lower than those in control extracts. The phosphorylase phosphatase activity of R6-PP1c and the concentration of R6 protein were unaffected by these treatments. Insulin administration to diabetic rats restored the levels of R5 and G(L) and their associated activities. The regulation of R5 protein levels by insulin was shown to correspond to changes in the level of the mRNA, as has been found for G(L). The in vitro glycogen synthase phosphatase/phosphorylase phosphatase activity ratio of R5-PPlc was lower than that of G(L)-PPlc, suggesting that R5-PPlc may function as a hepatic phosphorylase phosphatase, whereas G(L)-PPlc may be the major hepatic glycogen synthase phosphatase. In hepatic lysates, more than half the R6 was present in the glycogen-free supernatant, suggesting that R6 may have lower affinity for glycogen than R5 and G(L).

AB Protein phosphatase-1 (PP-1) and -2A (PP-2A), two regulatory subunits of PP-1, the glycogen-binding subunit ${\tt G}$ and inhibitor-2 (I-2), kinase FA, and casein kinase II (CK-II) were investigated in skeletal muscle of diabetic rats 2 days after streptozotocin injection. FA and CK-II activate PP-1 in vitro and might be involved in the activation of PP-1 by insulin. Following muscle fractionation we found that (1) diabetes decreased both basal and trypsin-stimulated PP-1 activities; the decrease was more significant in the glycogen-bound and microsomal fractions than in the cytosol (cytosolic PP-1 decreased as specific activity but not as activity/g of muscle); also PP-2A was lower in diabetic cytosols; (2) less G was immunoprecipitated from diabetic glycogen-bound fractions compared to controls, while I-2 was not significantly changed; (3) diabetes decreased also FA (assayed as PP-1 activator) and CK-II (assayed using a synthetic peptide as substrate); (4) diabetes did not have any effect on phosphorylase (a + b) activity in the glycogen-bound fraction. Altogether the data show that acute diabetes decreased PP-1, one of its regulatory subunits and two potentially physiological regulators of PP-1, in addition to PP-2A. This may indicate that insulin is responsible for the long-term regulation of the same enzymes that are also under acute insulin control.

Liver supernatant from normal and alloxan-diabetic rats was fractionated by DEAE-cellulose chromatography and the separated phosphoprotein phosphatase fractions were assayed with [32P]histone f2b, [32P]

phosphorylase a and [32P]phosphorylase kinase as substrates. In diabetic rat liver, one of the phosphatase fractions found in the normal liver was significantly reduced. This fraction was identified as a mixture of the spontaneously active form and the ATP . Mg-dependent form of phosphoprotein phosphatase-1 (Fc) based on sensitivity to inhibitor-2, substrate specificity, and the fact that it could be activated 42-70% by glycogen synthase kinase-3 in the presence of ATP . Mq. Further analysis of this fraction showed that liver cytosol from diabetic rats contained 62-79% lower spontaneously active phosphatase-1 activity and 40-51% lower combined spontaneously active and ATP . Mg-dependent protein phosphatase-1 (Fc)

activity. Insulin administration increased the spontaneously active and the ATP . Mg-dependent protein phosphatase-1

activities approximately 45% and 36%, respectively, in alloxan-diabetic rats. These data imply that the lower levels of spontaneously active phosphatase-1 activity in diabetic rat liver cannot be explained by presuming phosphatase-1 to have been present as Fc, the inactive form. Moreover, insulin restored the total activity of the spontaneously active and activatable forms of phosphatase-1 to those present in normal liver implying that both forms of phosphatase-1 activity are under hormonal control.

 $\mbox{GAC1}$ and $\mbox{GLC7}$ encode regulatory and catalytic subunits, respectively, of a AB type 1 phosphatase (PP1) in Saccharomyces cerevisiae that controls glycogen synthesis by regulating the phosphorylation state of glycogen synthase (Gsy2p). To investigate the role of Gaclp in this process, a set of GAC1 deletions were tested for their ability to complement a gac1 null mutation and to associate with Glc7p and with Gsy2p. The N-terminal 93 amino acids of Gaclp are necessary and sufficient for the interaction with Glc7p, whereas a region spanning residues 130-502 is required for Gsy2p binding. Both domains are required for full activity in vivo, although the Glc7p-binding domain retains some residual activity and can alter the phosphorylase a phosphatase activity of Glc7p in vitro. Further mutational analysis showed that Val71 and Phe73 of Gaclp are necessary for binding to Glc7p, while Asn356 and Tyr357 of Gaclp are necessary for binding to Gsy2p. These results suggest that Gaclp targets PPI to its substrate Gsy2p and that Gacip may alter the catalytic activity of PP . Our data also show that overexpression of Gaclp affects glucose repression and ion homeostasis, two additional targets of GLC7, suggesting that multiple regulatory subunits compete for Glc7p binding in vivo.

The activity and allosteric properties of plant phosphoenolpyruvate AR carboxylase (PEPC; EC 4.1.1.31) are controlled posttranslationally by specific reversible phosphorylation of a strictly conserved serine residue near the N-terminus. This up/down-regulation of PEPC is catalyzed by a dedicated and highly regulated serine/threonine (Ser/Thr) kinase (PEPC-kinase) and an opposing type-2A Ser/Thr phosphatase (PP2A). In marked contrast to PEPC-kinase, the PP2A holoenzyme from photosynthetic tissue has been virtually unstudied to date. In the present investigation, we have partially purified and characterized the native form of this PP2A from illuminated leaves of maize (Zea mays L.), a C4 plant, using maize [32P]PEPC as substrate. Various conventional chromatographic matrices, together with thiophosphorylated C4 PEPC-peptide and microcystin-LR affinity-supports, were exploited for the enrichment of this PP2A from soluble leaf extracts. Biochemical and immunological results indicate that the C4-leaf holoenzyme is analogous to other eukaryotic PP2As in being a approximately 170-kDa heteromer comprised of a core PP2Ac-A heterodimer (approximately 38- and approximately 65-kDa subunits, respectively) complexed with a putative, approximately 74-kDa B-type regulatory/targeting subunit. This heterotrimer lacks any strict substrate specificity in that it dephosphorylates C4 PEPC, mammalian phosphorylase a, and casein in vitro. This activity is independent of free Me2+, insensitive to levamisole and the Inhibitor-2 protein that targets PP1, activated by several polycations such as protamine and poly-L-lysine, and highly sensitive to inhibition by microcystin-LR and okadaic acid (IC50 approximately 30 pM), all of which are diagnostic features of yeast and mammalian PP2As. In addition, this C4-leaf PP2A holoenzyme (i) is inhibited in vitro by physiological concentrations of certain C4 PEPC-related metabolites (L-malate, PEP, glucose 6-phosphate, but not the activator glycine) when either 32P-labeled maize PEPC or rabbit muscle

phosphorylase a is used as substrate, suggesting a direct effect on this Ser/Thr phosphatase; and (ii) displays, at best, only modest light/dark effects in vivo on its apparent molecular mass, component core subunits and activity against C4 PEPC, in marked contrast to the opposing activity of PEPC-kinase in C4 and Crassulacean acid metabolism leaves. This report represents one of the few studies of a heteromeric PP2A holoenzyme from photosynthetic tissue that dephosphorylates a known target enzyme in plants, such as PEPC, sucrose-phosphate synthase or nitrate reductase.

DOCUMENT TYPE: Conference LANGUAGE: English SUMMARY LANGUAGE: English

The activity of protein phosphatase 1 (PP1) is

controlled by targeting subunits, many of which are though to bind to a hydrophobic channel in PP1 via a short consensus sequence termed the VxF motif. Eleven mutants were constructed in the gene encoding budding yeast PP1 (GLC7) in which one or more of the residues comprising the hydrophobic channel were changed to alanine. These mutants were tested for biological and biochemical activity, and for their ability to associate with three PP1 binding proteins. All eleven mutants were

expressed in yeast and found to retain phosphatase activity towards myelin

basic protein. However, many mutants were deficient in

phosphorylase a phosphatase activity and were

hypersensitive to trypsin digestion. Five of the eleven were unable to complement the lethality of a glc7::LEU2 deletion. Many of the mutants were deficient in **binding** VxF motif-containing targeting subunits that regulate glucose repression and glycogen accumulation (Gaclp and Reglp) but all retained the ability to associate with Sds22p, a regulatory subunit that lacks this motif. The subcellular locations at which Glc7p normally accumulates (bud neck, nucleolus, spindle pole body) were missing in several of the mutants. Together, these results demonstrate the importance of the hydrophobic channel for regulating many cellular pathways and for the proper subcellular localization of Glc7p. The lack of phosphorylase a

phosphatase activity and trypsin-sensitivity in many of the mutants $% \left(1\right) =\left(1\right) \left(1\right) +\left(1\right) \left(1\right) \left(1\right) +\left(1\right) \left(1$ suggests that the channel may not act solely as a binding site for regulatory subunits.

    Three functional domains are identified in the glycogen-targeting subunit
     (GL) of rat liver protein phosphatase 1. Amino acid
     residues 94-267 of GL are required for binding to glycogen, the
    phosphorylase a-binding site lies in the
     C-terminal 16 amino acids, and the protein phosphatase
     1-binding domain lies between residues 59 and 94. The present
     invention relates to to the C-terminal 16-amino acid domain
     (PEWPSYGYEKLYPYY) domain, which is useful for treating disorders assocd.
     with abnormal blood glucose levels in mammals, such as Type I
     and Type II diabetes. The invention also relates to methods of making and
     using the peptide and related compds. which block the interaction of
    phosphorylase a with GL of protein
    phosphatase 1.

    An in vitro model of ischemia was obtained by subjecting PC12 cells
     differentiated with nerve growth factor to a combination of
    glucose deprivation plus anoxia. Immediately after the ischemic
    period, the protein synthesis rate was significantly inhibited (80%) and
    western blots of cell extracts revealed a significant accumulation of
    phosphorylated eukaryotic initiation factor 2, alpha subunit, eIF2(alphaP)
     (42%). Upon recovery, eIF2(alphaP) levels returned to control values after
     30 min, whereas protein synthesis was still partially inhibited (33%) and
     reached almost control values within 2 h. The activities of the mammalian
     eIF2alpha kinases, double-stranded RNA-activated protein kinase, mammalian
     GCN2 homologue, and endoplasmic reticulum-resident kinase, were
     determined. None of the eIF2alpha kinases studied showed increased
     activity in ischemic cells as compared with controls. Exposure of cells to
     cell-permeable inhibitors of protein
    phosphatases 1 and 2A, calyculin A or tautomycin, induced dose-
     and time-dependent accumulation of eIF2(alphaP), mimicking an ischemic
     effect. Protein phosphatase activity, as measured with
     [(32)P]phosphorylase a as a substrate, diminished
    during ischemia and returned to control levels upon 30-min recovery. In
```

addition, the rate of eIF2(alphaP) dephosphorylation was significantly lower in ischemic cells, paralleling both the greatest translational inhibition and the highest eIF2(alphaP) levels. The endogenous phosphatase

	Fa	
N.	tue v under the second of the	

activity from control and ischemic extracts showed different sensitivity to inhibitor 2 and fostriecin in in vitro assays, inhibitor-2 effect in ischemic cells being lower than in control cells. Together these results indicate that an eIF2alpha phosphatase, probably protein phosphatase 1, is implicated in the ischemia-induced eIF2(alphaP) accumulation in PC12 cells.

The effect of insulin on glycogen synthesis and key enzymes of glycogen metabolism, glycogen phosphorylase and glycogen synthase, was studied in HepG2 cells. Insulin stimulated glycogen synthesis 1.83-3.30 fold depending on insulin concentration in the medium. Insulin caused a maximum of 65% decrease in glycogen phosphorylase 'a' and 110% increase in glycogen synthase activities in 5 min. Although significant changes in enzyme activities were observed with as low as 0.5 nM insulin level, the maximum effects were observed with 100 nM insulin. There was a significant inverse correlation between activities of glycogen phosphorylase 'a' and glycogen synthase 'a' (R2= 0.66, p < 0.001). Addition of 30 mM glucose caused a decrease in phosphorylase 'a' activity in the absence of insulin and this effect was additive with insulin up to 10 nM concentration. The inactivation of **phosphorylase 'a'** by insulin was prevented by wortmannin and rapamycin but not by PD98059. The activation of glycogen synthase by insulin was prevented by wortmannin but not by PD98059 or rapamycin. In fact, PD98059 slightly stimulated glycogen synthase activation by insulin. Under these experimental conditions, insulin decreased glycogen synthase kinase-3beta activity by 30-50% and activated more than 4-fold particulate protein

phosphatase- activity and 1.9-fold protein kinase B activity;
changes in all of these enzyme activities were abolished by wortmannin.
The inactivation of GSK-3beta and activation of PKB by insulin were
associated with their phosphorylation and this was also reversed by
wortmannin. The addition of protein phosphatase-1

inhibitors, okadaic acid and calyculin A, completely abolished the effects of insulin on both enzymes. These data suggest that stimulation of glycogen synthase by insulin in HepG2 cells is mediated through the PI-3 kinase pathway by activating PKB and PP-1G and inactivating GSK-3beta. On the other hand, inactivation of phosphorylase by insulin is mediated through the PI-3 kinase pathway involving a rapamycin-sensitive p70(s6k) and PP-1G. These experiments demonstrate that insulin regulates glycogen phosphorylase and glycogen synthase through (i) a common signaling pathway at least up to PI-3 kinase and bifurcates downstream and (ii) that PP-1 activity is essential for the effect of insulin.

The glycogen-associated regulatory subunit of protein phosphatase-1 (PP-1G) plays a major role in insulin-stimulated glycogen synthesis and thus the regulation of nonoxidative glucose disposal in skeletal muscle. In a general population of Caucasians a polymorphism at codon 905 of PP-1G from an aspartate to tyrosine has been reported to be associated with insulin resistance and hypersecretion. In this report functional studies were performed on rat skeletal muscle L6 cells stably transfected with an Asp905Tyr mutant PP-1G to evaluate the impact of this mutation on cellular responsiveness to insulin and cAMP. Although transfection resulted in a 3-fold increase in mutant PP-1G subunit expression, basal and insulin-stimulated PP-1 catalytic activities were decreased when compared with L6 cells transfected with wild-type PP-1G. The Asp905Tyr mutation resulted in an increase in cellular sensitivity to cAMP agonist, resulting in an inhibition of insulin's stimulatory effect on glycogen synthesis. More importantly, low concentrations of (Bu)2cAMP completely reversed insulin's stimulatory effects on glycogen synthesis when added to insulin-treated cells expressing mutant PP-1G. This was due to a rapid activation of glycogen phosphorylase a and a simultaneous inactivation of glycogen synthase via cAMP-mediated reductions in insulin-stimulated PP-1 catalytic activities. We conclude that an Asp905Tyr mutation of PP-1G is accompanied by a relative increase in sensitivity to cAMP agonists as well as a diminished capacity of the mutant PP-1G to effectively mediate the inhibitory effects of insulin on glycogen breakdown via PP-1 activation.

The kinetic theory of the substrate reaction during modification of enzyme activity has been applied to a study of the dephosphorylation of phosphorylase a by protein phosphatase

-1 (ppase-1). On the basis of the kinetic equation of the substrate reaction in the presence of ppase-1, all the inactivation rate constants for the free enzyme and the enzyme-substrate(s) complexes have been determined. Binding of the allosteric substrate, glucose 1-phosphate, to one subunit of phosphorylase a

protects completely against ppase-1 action on either the same subunit or the adjacent subunit, whereas binding of the non-allosteric substrate, glycogen, to one subunit protects this subunit partially, but has no effect on the modification on the neighbouring subunit. Analysis of

the data suggests that the allosteric behaviour of phosphorylase a can be interpreted in terms of a modified concerted model. The present method also provides a novel approach for studying dephosphorylation reactions. Since the experimental conditions used resemble more closely the in vivo situation where the substrate is constantly being turned over while the enzyme is being modified, this new method would be particularly useful when the regulatory mechanism of the reversible phosphorylation reaction toward certain enzymes is being assessed.

1,4-Dideoxy-1,4-imino-D-arabinitol (DAB) was identified previously-as a potent inhibitor of both the phosphorylated and non-phosphorylated forms of glycogen phosphorylase (EC 2.4.1.1). In the present study, the effects of DAB were investigated in primary cultured rat hepatocytes. The transport of DAB into hepatocytes was dependent on time and DAB concentration. The rate of DAB transport was 192 pmol/min per mg of protein per mM DAB(medium-concentration). In hepatocytes, DAB inhibited basal and glucagon-stimulated glycogenolysis with IC50 values of 1.0 +/- 0.3 and 1.1 +/- 0.2 mu M, respectively. The primary inhibitory effect of DAB on glycogenolysis was shown to be due to inhibition of glycogen phosphorylase but, at higher concentrations of DAB, inhibition of the debranching enzyme (4-alpha-glucanotransferase, EC 2.4.1.25) may have an effect. No effects on glycogen synthesis were observed, demonstrating that glycogen recycling does not occur in cultured hepatocytes under the conditions tested. Furthermore, DAB had no effects on phosphorylase kinase, the enzyme responsible for phosphorylation and thereby activation of glycogen phosphorylase, or on protein phosphatase 1, the enzyme responsible for inactivation of glycogen phosphorylase

through dephosphorylation.

sensitivities to inhibitors of this enzyme. The enzymic activity of the Grp78-dissocd. enzyme was much lower at whole range of concns. of a substrate (phosphorylase a) than that of the holoenzyme; the Km value was about ten-fold higher in Grp78-dissocd. enzyme than in holoenzyme, while the Vmax was similar. IC50s of the Grp78-dissocd. enzyme for three inhibitors (microcystin-LR, inhibitor-2, and okadaic acid) were more than ten-fold higher than those of the holoenzyme. These results indicate that the Grp78 subunit modulates the activity of PP1.gamma.2 through its actions to control the binding of substrates or inhibitors to PP1.gamma.2. (c) 1999 Academic Press.

ABSTRACT IS AVAILABLE IN THE ALL AND IALL FORMATS

Protein Phosphatase-1 (PP-1) appears to be the key component of the insulin signalling pathway which is responsible for bridging the initial insulin-simulated phosphorylation cascade with the ultimate dephosphorylation of insulin sensitive substrates. Dephosphorylations catalyzed by PP-1 activate glycogen synthase (GS) and simultaneously inactivate phosphorylase a and phosphorylase kinase promoting glycogen synthesis. Our in vivo studies using L6 rat skeletal muscle cells and freshly isolated adipocytes indicate that insulin stimulates PP-1 by increasing the phosphorylation status of its regulatory subunit (PP-1(G)). PP-1 activation is accompanied by an inactivation of Protein Phosphatase-2A (PP-2A) activity. To gain insight into the upstream kinases that mediate insulin-stimulated PP-1(G) phosphorylation, we employed inhibitorsof the ras/MAPK, PI3-kinase, and PKC signalling pathways. These inhibitor studies suggest that PP-1, phosphorylation is mediated via a complex, cell type specific mechanism involving PI3-kinase/PKC/PKB and/or the ras/MAP kinase/Rsk kinase cascade. CAMP agonists such as SpcAMP (via PKA) and TNF-alpha (recently identified as endogenous inhibitor of insulin action via ceramide) block insulin-stimulated PP-1(G) phosphorylation with a parallel decrease of PP-1 activity, presumably due to the dissociation of the PP-1 catalytic subunit from the regulatory G-subunit. It appears that any agent or condition which interferes with the insulin-induced phosphorylation and activation of PP-1, will decrease the magnitude of insulin's effect on downstream metabolic processes. Therefore, regulation of the PP-1(G) subunit by site-specific phosphorylation plays an important role in insulin signal transduction in target cells. Mechanistic and functional studies with cell lines expressing PP-1(G) subunit site-specific mutations will help clarify

Protein dephosphorylation by phosphatase PPI plays a central role in mediating the effects of insulin on glucose and lipid metabolism. A PP1C-targeting protein expressed in 3T3-L1 adipocytes (called PTG, for protein targeting to glycogen) was cloned and characterized. PTG was expressed predominantly in insulin-sensitive tissues. In addition to binding and localizing PPIC to glycogen, PTG formed complexes with phosphorylase kinase, phosphorylase a, and glycogen synthase, the primary enzymes involved in the hormonal regulation of glycogen metabolism. Overexpression of PTG markedly increased basal and insulin-stimulated glycogen synthesis in Chinese hamster ovary cells overexpressing the insulin receptor, which do not express endogenous PTG. These results suggest that PTG is critical for glycogen metabolism, possibly functioning as a molecular scaffold.

Non-metabolized glucose derivatives may cause inactivation of phosphorylase but, unlike glucose, they are unable to elicit activation of glycogen synthase in isolated hepatocytes. We report here that, after the previous inactivation of phosphorylase by one of these glucose derivatives (2-deoxy-2-fluoro-alpha-glucosyl fluoride), glycogen synthase was progressively activated by addition of increasing concentrations of glucose. Under these conditions, the degree of activation of glycogen synthase was linearly correlated with the intracellular glucose-6-phosphate (Glc-6-P) concentration. Addition of glucosamine, an inhibitor of glucokinase, decreased both parameters in parallel. Further experiments using an inhibitor of either protein kinases (5-iodotubercidin) or protein phosphatases (microcystin) in isolated hepatocytes indicated that Glc-6-P does not affect glycogen-synthase kinase activity but enhances the glycogen-synthase phosphatase reaction. Experiments in vitro showed that the synthase phosphatase activity of glycogen-bound type-1 protein phosphatase was increased by physiological concentrations of Glc-6-P (0.1-0.5 mM), but not by 2.5 mM fructose-6-P, fructose-1-P or glucose-1-P. At physiological ionic strength, the glycogen-associated synthase phosphatase activity was nearly entirely Glc-6-P-dependent, but Glc-6-P did not relieve the strong inhibitory effect of phosphorylase a

. The large stimulatory effects of 2.5 mM Glc-6-P, with glycogen synthase b and phosphorylase a as substrates, appeared to be

mostly substrate-directed, while the modest effects observed with casein and histone IIA pointed to an additional stimulation of glycogen-bound protein phosphatase-1 by Glc-6-P. We conclude that glucose elicits hepatic synthase phosphatase activity both by removal of the inhibitor, phosphorylase a, and by generation of the stimulator, Glc-6-P.

ABSTRACT IS AVAILABLE IN THE ALL AND IALL FORMATS

The purpose of this study was to identify the mechanism by which proglycosyn and resorcinol decrease the **phosphorylase a** content and the fructose 2,6-bisphosphate concentration in isolated hepatocytes. The intracellular concentrations of the glucuronide derivatives of proglycosyn and resorcinol have been measured by HPLC in hepatocytes incubated for 5 min or 30 min with different concentrations of these agents. At both times, there was a reciprocal relationship between the **phosphorylase a** content and the intracellular concentration of the glucuronidated metabolites, half-maximal inactivation being observed at about 2 mu lmol/g protein and 0.25 mu mol/g protein for resorcinylglucuronide and proglycosyn-glucuronide, respectively. Glycogen

synthase was not significantly activated by these agents after 5 min but was well activated after 30 min.

Preincubation of hepatocytes with 1 mM resorcinol or with 100 mu M proglycosyn resulted in a decrease in the rate at which phosphorylase was

activated following the addition of glucagon, vasopressin, the **protein phosphatase inhibitor** calyculin A or the calcium ionophore A 23187, but did not reduce the rate of synthase inactivation. Proglycosynglucuronide and resorcinylglucuronide inhibited phosphorylase kinase in liver Sephadex filtrates, with K-i values of about 0.75 mM and 4 mM, respectively. Preincubation of the filtrates with ATP and cAMP decreased the sensitivity of phosphorylase kinase to resorcinylglucuronide by about fourfold. It is concluded that the effect of resorcinol and proglycosyn on the **phosphorylase** a content is due, at least partly, to an inhibition of phosphorylase kinase by their glucuronidated metabolites.

Resorcinol and proglycosyn caused a parallel decrease in the concentration of fructose 2,6-bisphosphate and of hexose 6-phosphates, without significantly changing the activity of 6-phosphofructo-2-kinase. The decrease in the fructose 2,6-bisphosphate concentration appears therefore to be secondary to the decrease in the hexose 6-phosphate concentration.

alpha-D-Glucose is a weak inhibitor of glycogen phosphorylase b (Ki = 1.7 mM) and acts as a physiological regulator of hepatic glycogen metabolism. Glucose binds to phosphorylase at the catalytic site and results in a conformational change that stabilizes the inactive T state of the enzyme, promoting the action of protein phosphatase 1 and stimulating glycogen synthase. It has been suggested that, in the liver, glucose analogues with greater affinity for glycogen phosphorylase may result in a more effective regulatory agent. Several alpha- and betaanhydroglucoheptonic acid derivatives and 1-deoxy-1-thio-beta-Dglucose analogues have been synthesized and tested in a series of crystallographic and kinetic binding studies with glycogen phosphorylase. The structural results of the bound enzyme-ligand complexes have been analyzed, together with the resulting affinities, in an effort to understand and exploit the molecular interactions that might give rise to a better inhibitor. This work has shown the following: (i) Similar affinities may be obtained through different sets of interactions. Specifically, in the case of the alpha- and beta-glucose -C-amides, similar Ki's (0.37 and 0.44 mM, respectively) are obtained with the alpha-anomer through interactions from the ligand via water molecules to the protein and with the beta-anomer through direct interaction from the ligand to the protein. Thus, hydrogen bonds through water can contribute binding energy similar to that of hydrogen bonds directly to the protein. (ii) Attempts to improve the inhibition by additional groups did not always lead to the expected result. The addition of nonpolar groups to the alpha-carboxamide resulted in a change in conformation of the pyranose ring from a chair to a skew boat and the consequent loss of favorable hydrogen bonds and increase in the Ki. (iii) The addition of polar groups to the alpha-carboxamide led to compounds with the chair conformation, and in the examples studied, it appears that hydration by a water molecule may provide sufficient stabilization to retain the chair conformation. (iv) The best inhibitor was N-methyl-beta-glucose-C-carboxamide (Ki = 0.16 mM), which showed a 46-fold improvement in Ki from the parent beta-D-glucose. The decrease in Ki may be accounted for by a single hydrogen bond from the amide nitrogen to a main-chain carbonyl oxygen, an increase in entropy through displacement of a water molecule, and favorable van der Waals

AR Addition of micromolar concentrations of the adenosine derivative 5-iodotubercidin (Itu) initiates glycogen synthesis in isolated hepatocytes by causing inactivation of phosphorylase and activation of glycogen synthase (Fluckiger-Isler and Waiter (1993) Biochem. J. 292, 85-91]. We report here that Itu also antagonizes the effects of saturating concentrations of glucagon and vasopressin on these enzymes. The Itu-induced activation of glycogen synthase could not be explained by the removal of phosphorylase a (a potent inhibitor of the glycogen-associated synthase phosphatase). When tested on purified enzymes, Itu did not affect the activities of the major Ser/Thr-specific protein phosphatases (PP-1, PP-2A, PP-2B and PP-2C), but it inhibited various Ser/Thr-specific protein kinases as well as the tyrosine kinase activity of the insulin receptor (IC50 between 0.4 and 28 mu M at 10-15 mu M ATP), Tubercidin, which did not affect glycogen synthase or phosphorylase in liver cells, was 300 times less potent as a protein kinase inhibitor. Kinetic analysis of the inhibition of casein kinase-1 and protein kinase A showed that Itu acts as a competitive inhibitor with respect to ATP, and as a mixed-type inhibitor with respect to the protein substrate. We propose that Itu inactivates phosphorylase and activates glycogen synthase by inhibiting phosphorylase kinase and various glycogen synthase kinases. Consistent with the broad specificity of Itu in vitro, this compound decreased the phosphorylation level of numerous phosphopolypeptides in intact liver cells. Our data suggest that at least some of the biological effects of Itu can be explained by an inhibition of protein kinases.

AR Phenylarsine oxide (PAO) has previously been shown to inhibit insulin-stimulated glucose transport without affecting insulin binding and tyrosine kinase activity of insulin receptor (S. C. Frost and M. D. Lane. J. Biol. Chem. 260: 2646-2652, 1985). This study examines the effect of PAO on insulin's ability to activate adipocyte protein phosphatase 1 (PP-1) and dephosphorylate GLUT-4, the insulin-sensitive glucose transporter. In particulate fractions, insulin stimulated PP-1 activity (40% increase over basal with phosphorylase a) in a time- and dose-dependent manner (half-maximal effect of 0.89 nM in 1 min). Insulin did not alter cytosolic PP-1 activity. With GLUT-4 as a substrate, insulin caused more than twofold stimulation of particulate PP-1 activity. Addition of PAO (5 microM) before or after insulin treatment abolished insulin's effect on PP-1 activation. The presence of 2,3-dimercaptopropanol (200 microM) prevented the effect of PAO on PP-1 activation and glucose uptake. In addition, PAO significantly increased GLUT-4 phosphorylation, blocked insulin-stimulated dephosphorylation, and partially diminished insulin-stimulated translocation of GLUT-4. We conclude that PAO may interfere with the components of insulin signal transduction pathways that lead to the activation of PP-1 and this may be responsible for the observed inhibition in insulin action.

AB Previous studies have shown that a human insulin receptor lacking the COOH-terminal 43-amino acid domain (HIRDELTACT) displays a compromised ability to stimulate glucose transport and glycogen synthase, whereas mitogenic signaling and stimulation of the insulin receptor tyrosine kinase activity remain intact (Maegawa, H., McClain, D. A., Freidenberg, G., Olefsky, J. M., Napier, M., Lipari, T., Dull, T. J., Lee, J., and Ullrich, A. (1988) J. Biol. Chem. 263, 8912-8917). In this study, we examined the effect of insulin on protein phosphatase 1 (PP-1) activity and phosphorylation in cells expressing wild-type human insulin receptor (HIRc) and HIRDELTACT cells using phosphorylase a as substrate in the presence of 3 nM okadaic acid. Basal PP-1 activity was significantly lower in HIRDELTACT than in HIRc cells (p <0.05). Insulin stimulated PP-1 activity in HIRc cells (25-30% increase over basal activity) in a time- and dose-dependent manner. Insulin failed to stimulate PP-1 activity in HIRDELTACT cells. Western blotting with the catalytic subunit antibody and the regulatory subunit antibody revealed similar amounts of the 37-kDa band (catalytic subunit) and the 160-kDa band (presumed regulatory subunit) in HIRc and HIRDELTACT cells. We conclude that the COOH-terminal domain of the insulin receptor is an important element in mediating the effect of insulin on PP-1 and suggest that activation of PP-1 may be linked to signaling insulin's metabolic actions.

ABSTRACT IS AVAILABLE IN THE ALL AND IALL FORMATS

In this study, we examined the mechanism of inhibition of phosphoserine phosphatase (PSPase) activity by elevated [Ca2+]i in insulin target cells. In in vitro studies, isolated rat adipocytes were incubated with either 40 mM K+ or parathyroid hormone (PTH) (20 ng/ml) for 1 h. In in vivo studies, rats were injected with PTH (three hourly injections of 40-mu-g intraperitoneally) prior to isolation of either adipocytes or skeletal muscle. Under these conditions, intracellular [Ca2+]i changed from 100 +/-8.7 to 263 +/- 10.5 nM. There was a concomitant 30% decrease in adipocyte PSPase activity and a 35% decrease in skeletal muscle PSPase activity, assayed using P-32-labeled phosphorylase "a" as a

State of the State of

100

the state of the state of

substrate. The inhibition of PSPase was accompanied by a 60% increase in adipocytes (p < 0.05) and a 118% increase (p < 0.01) in skeletal muscle inhibitor 1 (I1) activities, respectively. Since Il is active only in the phosphorylated state, we studied the effect of [Ca2+]i on I1 phosphorylation. Sodium dodecyl sulfate-polyacrylamide gel electrophoresis of heat treated extracts immunoprecipitated with I1 antibody revealed significant increase in P-32 incorporation (45-60%, p < 0.05) into I1 protein in cells with elevated [Ca2+]i. Nitrendipine, a calcium channel blocker, completely prevented increases in I1 phosphorylation and activity in cells exposed to K+ but was only partially effective in the PTH-treated cells. In contrast, a cyclic AMP antagonist, RpcAMP, prevented both the K+- and the PTH-induced increases in Il phosphorylation and activity, even though it failed to block the elevations in [Ca2+]i in these cells. We conclude that [Ca2+]i-induced and cAMP-mediated phosphorylation and activation of Il results in inhibition of PSPase activity in insulin target cells. The inhibition of PSPases may cause inappropriate serine dephosphorylation of substrates of insulin action resulting in insulin resistance.

AB Fructose 2,6-bisphosphate and glucose 1,6-bisphosphate are apparent noncompetitive inhibitors of porcine protein phosphatase 2A2 having Ki values of 0.38 and 0.56 mM,

respectively. The inhibitory effects were on the catalytic subunit and were not substrate directed. In addition, fructose 2,6-bisphosphate caused a time-dependent inactivation of phosphatase activity toward

phosphorylase a. This inactivation was antagonized by

MnCl2. The fructose 2,6-bisphosphate-inactivated enzyme had increased p-nitrophenyl phosphate phosphatase activity. These effects are similar to the known effects of ATP on type 2A phosphatases.

3						

concentration of glucose are reviewed. The control of glycogen metabolism occurs by phosphorylation and dephosphorylation of both glycogen phosphorylase and glycogen synthase catalysed by various protein kinases and protein phosphatases. The hormonal effect is to stimulate glycogenolysis by the intermediary of cyclic AMP, which activates directly or indirectly the protein kinases. The glucose effect is to activate the protein phosphatase system; this occurs by the direct binding of glucose to glycogen phosphorylase which is then a better substrate for phosphorylase phosphatase and is inactivated. Since phosphorylase a is a strong inhibitor of synthase phosphatase, its disappearance allows the activation of glycogen synthase and the initiation of glycogen synthesis. When glycogen synthesis is intense, the concentrations of UDPG and of glucose 6-phosphate in the liver decrease, allowing a net glucose uptake by the liver. Glucose uptake is indeed the difference between the activities of glucokinase and glucose 6-phosphatase. Since the Km of the latter enzyme is far above the physiological concentration of its substrate, the decrease in glucose 6-phosphate concentration proportionally reduces its activity. The control of glycolysis and of gluconeogenesis occurs mostly at the level of the interconversion of fructose 6-phosphate and fructose 1,6-bisphosphate under the action of phosphofructokinase 1 and fructose 1,6-bisphosphatase. Fructose 2,6-bisphosphate is a potent stimulator of the first of these two enzymes and an inhibitor of the second. It is formed from fructose 6-phosphate and ATP by phosphofructokinase 2 and hydrolysed by a fructose 2,6-bisphosphatase. These two enzymes are part of a single bifunctional protein which is a substrate for cyclic AMP-dependent protein kinase. Its phosphorylation causes the inactivation of phosphofructokinase 2 and the activation of fructose 2,6-bisphosphatase, resulting in the disappearance of fructose 2,6-bisphosphate. The other major effector of these two enzymes is fructose 6-phosphate, which is the substrate of phosphofructokinase 2 and a potent **inhibitor** of fructose 2,6-bisphosphatase; these properties allow the formation of fructose 2,6-bisphosphate when the level of glycaemia and secondarily that of fructose 6-phosphate is high.

Acetyl-CoA carboxylase from liver exhibits a linear inverse relationship AR between the ratio of enzymic activities at 0 and 2 mM citrate and the extent of phosphorylation by its kinase, and this citrate activity ratio method was used to examine the effect of nutritional conditions on the phosphorylation state of the enzyme. This method showed that the calculated phosphorylation state, being the extent of phosphorylation at sites accessible to carboxylase kinase, was highest in the livers of starved rats, lower in those fed normally, and lower still in starved rats which had been refed for 48 h on a fat-free diet. The actual values were 0.44, 0.26, and 0 mol of P/subunit, respectively, provided that liver samples were frozen rapidly to liquid nitrogen temperatures and extracted with stopping buffers at temperatures well below freezing. Normal homogenization with stopping buffers (containing inhibitors for protein kinases and phosphatases) resulted in much higher calculated phosphorylation states. The effect of nutritional conditions on the phosphorylation state as estimated reported above was confirmed by purifying the carboxylase from livers of rats, measuring the amount of phosphate which could be incorporated by carboxylase kinase, and comparing this with the phosphorylation state calculated from the citrate activity ratio method or the specific activity. Furthermore, treatment with protein phosphatase of carboxylase from starved rats resulted in the largest increase in specific activity, that from the starved/refed rats in the least. Finally, the effects of hyperglycemia on carboxylase and phosphorylase characteristics in the livers of intact rats were ascertained by taking liver samples and preparing crude extracts by the rapid freezing method described above. Hyperglycemia caused a rapid increase in the activity of the carboxylase and a rapid decrease in its putative phosphorylation state as measured by the citrate activity ratio method. Phosphorylase was also dephosphorylated, as indicated by a decrease in phosphorylase a activity. We conclude that the citrate activity ratio method is a valid test for the phosphorylation state of acetyl-CoA carboxylase in crude extracts of tissue.

AR Glycogen phosphorylase isolated from Drosophila melanogaster contains one pyridoxal 5'-phosphate per subunit; the coenzyme is in a hydrophobic environment. Fruit-fly **phosphorylase a** has lower KM for glucose-1-phosphate and is less sensitive to allosteric inhibitors than the b form of the enzyme. The amino acid composition of Drosophila phosphorylase differs from that of rabbit skeletal muscle phosphorylase. These two enzymes give distinct one dimensional peptide maps. The distribution of reactive SH-groups is markedly different in the insect and vertebrate phosphorylase. Fruit-fly phosphorylase a is dephosphorylated by either rabbit or Drosophila protein phosphatase-1 at a slower rate than

rabbit muscle phosphorylase a. MEDLINE DUPLICATE 16 L74 ANSWER 25 OF 31 ACCESSION NUMBER: 85097826 MEDLINE DOCUMENT NUMBER: 85097826 PubMed ID: 2981554 Effects of acidic and basic macromolecules on the activity TITLE: of protein phosphatase-1. AUTHOR: Erdodi F; Csortos C; Bot G; Gergely P SOURCE: BIOCHIMICA ET BIOPHYSICA ACTA, (1985 Jan 21) 827 (1) 23-9. Journal code: 0217513. ISSN: 0006-3002. Netherlands PUB. COUNTRY: DOCUMENT TYPE: Journal; Article; (JOURNAL ARTICLE) English LANGUAGE: FILE SEGMENT: Priority Journals ENTRY MONTH: 198503 ENTRY DATE: Entered STN: 19900320 Last Updated on STN: 19900320 Entered Medline: 19850320 AB The dephosphorylation of phosphorylase a by the catalytic subunit of protein phosphatase-1 obtained from rabbit skeletal muscle is inhibited by heparin in a noncompetitive manner with respect to phosphorylase a (Ki = 8 micrograms/ml). The inhibitory effect of heparin is also observed in the presence of effectors (e.g., ${\tt glucose}$ and AMP) modifying the dephosphorylation of phosphorylase a. Heat-stable protein inhibitors of protein phosphatase-1 can develop their inhibitory effect of the activity of protein phosphatase-1 even in the presence of heparin. The inhibitory effect of heparin and the heat-stable inhibitor-2 of phosphatase is additive. Polybrene, a heparin antagonist, prevented phosphatase-1 from the inhibition caused by heparin or the inhibitors. Proteins with basic character, histone fractions (H1, H3) and protamine sulfate, can counteract with the inhibitory effect of heparin, but they cannot intercept the actions of inhibitor-1 or -2. L74 ANSWER 26 OF 31 MEDLINE DUPLICATE 17 ACCESSION NUMBER: 84182583 MEDLINE DOCUMENT NUMBER: 84182583 PubMed ID: 6325187 TITLE: Purification and characterization of a protein phosphatase from rat liver acting on key enzymes of glucose metabolism. AUTHOR: Mieskes G; Brand I A; Soling H D SOURCE: EUROPEAN JOURNAL OF BIOCHEMISTRY, (1984 Apr 16) 140 (2) 375-83. Journal code: 0107600. ISSN: 0014-2956. PUB. The purification involved chromatography on DEAE-cellulose. Sephacryl S-200, fast protein liquid chromatography (FPLC) and sucrose density gradient centrifugation. It resulted in an almost homogeneous enzyme with a relative molecular mass, Mr, of 90 000 by gel filtration and sucrose gradient centrifugation and Mr = 44 500 by sodium dodecyl sulfate/polyacrylamide gel electrophoresis (SDS-PAGE). Therefore it seems to be a dimeric enzyme. This protein phosphatase (termed PFK-phosphatase) is completely dependent on Mg2+, which can be replaced partly by Mn2+. It can be eluted from DEAE-cellulose with 120 mM NaCl, is not affected by Ca2+, 100 microM trifluoperazine or the heat-stable inhibitor-2. Inhibition occurs with phosphate,

ammonium sulfate and fluoride. PFK-phosphatase dephosphorylates preferentially the alpha subunit of phosphorylase kinase (alpha/beta

histone and casein do not serve as substrates. The enzyme dephosphorylates

dephosphorylation ratio 5-10). Phosphorylase a, mixed

effectively the key enzymes of glucose metabolism

*.	

6-phosphofructo-1-kinase, fructose 1,6-bisphosphatase, pyruvate kinase and 6-phosphofructo-2-kinase. Using this **protein phosphatase** and the catalytic subunit of cAMP-dependent protein kinase, a complete phosphorylation, dephosphorylation and rephosphorylation cycle was possible with 6-phosphofructo-1-kinase as substrate.

AB Subtilisin BPN' hydrolyses a single peptide bond in phosphorylase

a. The two proteolytic fragments are attached to each other by noncovalent bonds in solution as shown by gel filtration and ultracentrifugation studies. The subtilisin nicked phosphorylase

a is inactive, however, still binds AMP and glucose as judged by equilibrium dialysis and fluorescence experiments. The modified enzyme can be dephosphorylated by protein phosphatase and AMP is an effective inhibitor of the dephosphorylation reaction. Glucose cannot cancel the AMP inhibition as well as cannot expel AMP from the nucleotide binding site. Thus a single nick in the polypeptide chain breaks the "communication" between the two ligand binding domains.

Muscle, heart (brain) and liver type isoenzymes of glycogen phosphorylase .alpha. were purifed to homogeneity from the pig skeletal muscle, heart and liver. Dephosphorylations of these isoenzymes by phosphoprotein phosphatases [EC 3.1.3.16] with a MW of 224,000 purified from these pig tissues were studied. Apparent Km values of phosphoprotein phosphatases from the skeletal muscle, heart, and liver for the homologous tissue type isoenzymes were 8.8, 9.0, and 8.8 .mu.M, respectively. Apparent Vmax values of dephosphorylation were 2.5, 6.5, and 1.2 nmol/min per unit, respectively (the unit was defined with rabbit skeletal muscle phosphorylase a as a substrate). Inhibition of dephosphorylation of the heart type isoenzyme by G-6-P was partially competitive with a Ki value of 0.05 mM. Though dephosphorylation of the liver type isoenzyme was inhibited competitively by G-6-P with a Ki value of 3.5 mM, dephosphorylation of the muscle type isoenzyme was not affected by 0.1-1 mM G-6-P. AMP was a strong competitive inhibitor of the dephosphorylation reactions with respect to substrate isoenzymes and also served as an allosteric effectors of the heart type isoenzyme. AMP concentrations required for 50% inhibition were 2 .mu.M with the muscle type isoenzyme, 1 .mu.M with the heart type isoenzyme, and 38 .mu.M with the liver type isoenzyme. Differences in Vmax values and in degrees of inhibition by the metabolites of dephosphorylation of the isoenzymes were

٠,

When isolated soleus muscles were incubated with adrenaline (I) [51-43-4], the level of **phosphorylase a** [9032-10-4] in ICR/IAn mice rose from 2.8% in the absence to 5.7% in the presence of I. In contrast, the level of phosphorylase a in normal mice was 2.4-11.1% in the absence of I, and increased to 17.7-23.9%in the presence of the hormone. The trace phosphorylase kinase [9001-88-1] activity in ICR/Ian mice is apparently capable of phosphorylating phosphorylase b in vivo and this enzyme is responsible for the very low level of phosphorylase a in resting soleus muscle of ICR/IAn mice, and perhaps even in normal mice. Since the residual enzyme cannot be activated by cyclic AMP-dependent protein kinase, the elevation of phosphorylase a by I may be caused by an inhibition of phosphorylase phosphatase. The possibility that this occurs through the activation of protein phosphatase inhibitor 1 by cyclic AMP-dependent protein kinase is discussed. Incubation of soleus muscles with I decreased the activity ratio (.+-.glucose 6-phosphate) of glycogen synthase (EC 2.4.1.11) [9014-56-6] from 0.24 to 0.08 in ICR/IAn mice and from 0.31 to 0.14 in C3H/He-mg or Swiss albino mice. Thus, the inactivation of glycogen synthase by I in resting soleus muscle does not result from the activation of phosphorylase kinase by cyclic AMP-dependent protein kinase. It is most likely mediated by a direct phosphorylation catalyzed by cyclic AMP-dependent protein kinase, although the activation of protein phosphatase inhibitor 1 may also contribute to the effect.

Phosphorylase kinase from rabbit skeletal muscle inhibited the dephosphorylation of phosphorylase a by phosphorprotein phosphatase. Phosphorylation (activation) of phosphorylase kinase by cAMP-dependent protein kinase greatly increased this inhibitory effect. Phosphoprotein phosphatase in inhibited by phosphorylase kinase in a reversible manner. The regulation by phosphorylase kinase at phosphoprotein phosphatase activity in different fractions of muscle extract and in the presence of various ligands was investigated. The presence of phosphorylase kinase also affected the ligand control of phosphatase activity. Phosphorylase kinase almost cancelled the inhibitory effect of AMP but hardly influenced the activating effect of glucose, G-6-P and caffeine. Calmodulin, glycogen and phosphorylase b (effectors of phosphorylase kinase) did not influence the inhibitory effect of phosphorylase kinase. Fractions of muscle extract also demonstrated the regulatory role of phosphorylase kinase. These fractions contained considerable amounts of phosphorylase kinase and phosphatase. Phosphatase activity was inhibited by phosphorylation reactions triggered by Mg2+ and ATP. Heat-stable inhibitors were absent from these fractions; therefore the transient inhibition of phosphatase could be attributed to the phosphorylation of endogenous phosphorylase kinase. The introduction between phosphorylase kinase and phosphatase resulted in a loss of AMP sensitivity, i.e., AMP did not inhibit the activity of phosphatase in those fractions. The phosphorylation of phosphorylase kinase is equally important both in the formation of enzymatically active phsophorylase a and in the inhibition of

Protein phosphatase-III, which catalyzes the

dephosphorylation of the .beta.-subunit of phosphorylase kinase, phosphorylase a, and glycogen synthetase bl and b2 (

glucose 6-phosphate-dependent forms produced by cyclic

AMP-dependent protein kinase and glycogen synthetase kinase-2, resp.), was purified 2500-fold from muscle. The mol. wt. was .apprx.130,000-140,000 and on Na dodecyl sulfate-polyacrylamide gel electrophoresis, one band of mol. wt. 35,000 was obsd., suggesting that the enzyme is a tetramer.

Protein phosphatase-II, which dephosphorylates phosphorylase kinase .alpha.-subunit, was also purified 2500-fold from muscle and its specificity compared to that of phosphatase-III. The different substrate specificities, mol. wts., and response to inhibitor-2 (a heat-stable protein from muscle specific for phosphatase-III) suggests that they are distinct proteins. Inhibitor-1, which only inhibits phosphatass-III after being phosphorylated by cyclic AMP-dependent protein kinase, was purified 4000-fold to homogeneity from skeletal muscle. The amino acid compn. showed the complete absence of cysteine, tyrosine, and tryptophan, a very low hydrophobic amino acid content, and a high content of glutamic acid and proline. The mol. wt. was .apprx.20,000. The possible physiol. roles of inhibitor-1 and inhibitor-2 are discussed.

BASIC-ABSTRACT:

NOVELTY - The medicinal use of a compound (C1) capable of blocking the interaction of phosphorylase alpha with the glycogen-targeting subunit (GL) of protein phosphatase I, is new.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for a method (A) for identifying C1.

USE - The invention is used to reduce the blood glucose level of a mammal, particularly a human (claimed), in hyperglycemic disorders such as type I or type II diabetes.

ADVANTAGE - None given

ABSTRACT:

The present invention relates to peptides which exhibit potent anti-viral activity. In particular, the invention relates to methods of using such peptides as inhibitory of respiratory syncytial virus ("RSV") transmission to uninfected cells. The peptides used in the methods of the invention are homologs of the DP-178 and DP-107 peptides, peptides corresponding to amino acid residues 638 to 673, and to amino acid residues 558 to 595, respectively, of the HIV-1.sub.LAI transmembrane protein (TM) gp41.

ABSTRACT:

A method of identifying <u>inhibitors of glycogen synthase</u> kinase-3 is provided. The method comprises providing a mixture comprising GSK-3, a phosphate source, and a GSK-3 substrate, incubating the mixture in the presence or absence of a test compound, and assessing the activity of GSK-3 in the mixture. A reduction of GSK-3 activity following incubation of the mixture in the presence of the test compound is an indication that the test compound is an inhibitor of GSK-3.

ABSTRACT:

The invention provides a novel transferase that acts on a saccharide, as a substrate, composed of at least three sugar units wherein at least three glucose residues on the reducing end are linked .alpha.-1,4 so as to transfer the .alpha.-1,4 lingages to a .alpha.-1,.alpha.-1 linkages; a process for producing the transferase; a gene coding for the same; and a process for producing an oligosaccharide by using the same. Also provided are a novel amylase that has a principal activity of acting on a saccharide, as a substrate, composed of at least three sugar units wherein at least three sugar units on the reducing end side are glucose units and the linkage between the first and the second glucose units is .alpha.-1,.alpha.-1 while the linkage between the second and the third glucose units is .alpha.-1,4 so as to liberate .alpha..alpha.-trehalose by hydrolyzing the .alpha.-1,4 linkage and another activity of hydrolyzing the .alpha.-1,4 linkage within the molecular chain of the substrate and that liberates disaccharides and/or monosaccharides as the principal final products; a process for producing the amylase; a gene coding for the same; and a process for producing .alpha.-trehalose by using a combination of the transferase and the amylase.

TITLE: Gene expression in bladder tumors

DATE-ISSUED: January 1, 2002

INVENTOR-INFORMATION:

NAME CITY STATE ZIP CODE COUNTRY

Orntoft; Torben F. DK 8230 Aabyhoj DK

US-CL-CURRENT: 435/6; 435/91.1, 435/91.2, 536/23.1, 536/24.3, 536/24.31, 536/24.33

ABSTRACT:

Methods for analyzing tumor cells, particularly bladder tumor cells employ gene expression analysis of samples. Gene expression patterns are formed and compared to reference patterns. Alternatively gene expression patterns are manipulated to exclude genes which are expressed in contaminating cell populations. Another alternative employs subtraction of the expression of genes which are expressed in contaminating cell types. These methods provide improved accuracy as well as alternative basis for analysis from diagnostic and prognostic tools currently available.

ABSTRACT:

Methods and model systems for identifying and characterizing new therapeutic agents, particularly proteins, which mimic or inhibit the activity of all interferons, Type I interferons, IFN-.alpha., IFN-.beta., or IFN-.gamma. The method comprises administering an interferon selected from the group consisting of IFN-.alpha., IFN .beta., IFN-.tau., IFN-.omega., IFN-.gamma., and combinations thereof to cultured cells, administering the candidate agent to a duplicate culture of cells; and measuring the effect of the candidate agent and the interferon on the transcription or translation of one or, preferably, a plurality of the interferon stimulated genes or the interferon repressed genes (hereinafter referred to as "ISG's" and "IRGs", respectively). The model system is an array with gene probes that hybridize with from about 100 to about 5000 ISG and IRG transcripts.

ABSTRACT:

Disclosed are methods and compositions comprising novel agouti polypeptides and the polynucleotides which encode them. Also disclosed are DNA segments encoding these proteins derived from human and murine cell lines, and the use of these polynucleotides and polypeptides in a variety of diagnostic and therapeutic applications. Methods, compositions, kits, and devices are also provided for identifying compounds which are <u>inhibitors</u> of agouti activity, and for altering fatty acid synthetase activity and intracellular calcium levels in transformed cells.

ABSTRACT:

The present invention relates to peptides which exhibit antifusogenic and antiviral activities. The peptides of the invention consist of a 16 to 39 amino acid region of a human respiratory syncytial virus protein. These regions were identified through computer algorithms capable of recognizing the ALLMOTI5, 107x178x4, or PLZIP amino acid motifs. These motifs are associated with the antifusogenic and antiviral activities of the claimed peptides.

ABSTRACT:

A method of altering an expression of a gene product in cells or an organism, comprising orally administering glutathione in an effective amount and under such conditions to alter a redox potential in the cells. The gene expression may be sensitive to redox potential through one or more of a process of induction, transcription, translation, post-translational modification, release, and/or through a receptor mediated process. The glutathione is preferably administered as an oral bolus of encapsulated pharmaceutically stabilized glutathione in a rapidly dissolving formulation to a mammal on an empty stomach.

TITLE: Preparation for the application of agents in mini-droplets

DATE-ISSUED: December 26, 2000

INVENTOR-INFORMATION:

NAME CITY STATE ZIP CODE COUNTRY

Cevc; Gregor Heimstetten DE

US-CL-CURRENT: 424/450; 424/94.3, 428/402.2

ABSTRACT:

The invention relates to a preparation for the application of agents in the form of minuscule droplets of fluid, in particular provided with membrane-like structures consisting of one or several layers of amphiphilic molecules, or an amphiphilic carrier substance, in particular for transporting the agent into and through natural barriers such as skin and similar materials. The preparation contains a concentration of edge active substances which amounts to up to 99 mol-% of the agent concentration which is required for the induction of droplet solubilization. Such preparations are suitable, for example, for the non-invasive applications of antidiabetics, in particular of insulin. The invention, moreover, relates to the methods for the preparation of such formulations.

ABSTRACT:

Methods for treating conditions associated with elevated, inappropriate or undesired post-prandial blood glucose levels are disclosed which comprise administration of an effective amount of an amylin agonist alone or in conjunction with other anti-gastric emptying agents. Methods for reducing gastric motility and delaying gastric emptying for therapeutic and diagnostic purposes are also described.

ABSTRACT:

The present invention relates to peptides which exhibit potent

anti-retroviral activity. The peptides of the invention comprise DP178 (SEQ ID:1) peptide corresponding to amino acids 638 to 673 of the HIV-1.sub.LAI gp41 protein, and fragments, analogs and homologs of DP178. The invention further relates to the uses of such peptides as inhibitory of human and non-human retroviral, especially HIV, transmission to uninfected cells.

ABSTRACT:

The present invention relates to viral peptides referred to as "DP107- and DP178-like" peptides. Specifically, the invention relates to isolated influenza A DP107- and DP178-like peptides which are identified by sequence search motif algorithms. The peptides of the invention exhibit antiviral activity believed to result from inhibition of viral induced fusogenic events.

ABSTRACT:

A new paradigm of disease centers around the metabolic pathways of S-adenosyl-L-methionine (SAM), the intermediates of these pathways and other metabolic pathways influenced by the SAM pathways. Methods are provided to analyze and modulate SAM pathways associated with a disease or condition. Such methods permit identification and utilization of diagnostic and therapeutic protocols and agents for such disease states and conditions.

ABSTRACT:

The present invention relates to peptides which exhibit antifusogenic and antiviral activities. The peptides of the invention consist of a 16 to 39 amino acid region of a simian immunodeficiency virus (SIV) protein. These regions were identified through computer algorithms capable of recognizing the ALLMOTI5, 107.times.178.times.4, or PLZIP amino acid motifs. These motifs are associated with the antifusogenic and antiviral activities of the claimed peptides.
